network thinking solutions

The Real Cost of Insufficient IT

Inadequate or lacking IT costs your company time and money

Downtime

How much does it cost your company when your systems are down? A recent study found downtime costs SMBs an average of $12,500 per hour

Data Loss

Data loss from inadequate or missing backups requires the work to be reproduced, wasting valuable time and resources

Cyberattacks

Almost two thirds of all SMBs experiencing a cyberattack go out of business with six months of the breach

Outdated Tech

Computers older than 4 years require so many repairs that it's cheaper to replace them than to keep pouring money into them

Lost Productivity

Your employees lose many minutes of work each day by not having the proper IT support they need when they need it

Businesses that use a "break/fix" approach to technology or rely on small in-house teams for IT support often feel they are saving money, but they are drastically underestimating costs related to these poor IT practices.

Learn how you can save money on IT while obtaining superior support, security and peace of mind
